64 PIN A/C row expansion bus – middle row B has about 5 ground pins spaced out

ROM Pack buffers address and control signals through LS244 buffers, and data through LS245 (R/W) gates direction.

PLA consumes A19-A15 (on pins 6 thru to 2), and decodes 5 x 32K ROMs on B0-B4 outputs, /DSL gates /OE. B5 drives ROM slot 0 (J1) , B6 drives ROM slot 1 (J2) , also B7 (input) appears on Slot 1, B8 drives /G on the LS245 data transceiver, and B9 drives /DTACK.

The PLA Pinout is as follows:

/VPA	1	20	5V
A15	2	19	/DTACK
A16	3	18	/G on LS245 Data Transceiver
A17	4	17	J2 Slot1 pin 28
A18	5	16	J2 Slot 1 /CE - pin 15
A19	6	15	J1 Slot 0 /CE – pin 15
/AS	7	14	/ROM4
J1 Slot0 pin 28	8	13	/ROM3
/ROM0	9	12	/ROM2
0V	10	11	/ROM1

The connections for the ROM slot headers are as follows:

A14	1	2	5V
A13	3	4	A12
A8	5	6	A7
A9	7	8	A6
A11	9	10	A5
/OE (/DS)	11	12	A4
A10	13	14	A3
/CE (B5 or B6)	15	16	A2
D7	17	18	A1
D6	19	20	A0
D5	21	22	D0
D4	23	24	D1
D3	25	26	D2
Module R/W (Output)	27	28	Host R/W (Input)
Module detect (Output)	29	30	0V

32 pin Expander (telecoms module)

(This is only partially reverse engineered).

5V	A1	C1	5V
4k7 pin 15 8051	A2	C2	Pin 27 ULA3
Pin 25 ULA3	A3	C3	Clear LS175

B_4052 pin 11	A12	C12	0V
A_4052 pin 3	A13	C13	NC
A_4052 pin 15	A14	C14	NC
Clear LS164	A15	C15	NC
Modem sound out	A16	C16	NC

IC19 and IC 20 on the main board are 28 pin ROM sockets wired exactly the same way as QL ROM Sockets – driven by ZX8301. ZX8302 is wired the same as Issue 5 QL (so sits on the video data bus)

ZX8302 – EXTINT is wired to voltage sensor for 9v battery. QL Network is brought out to 2 pads near the chip One serial port on the ZX8302 drives the RS432 printer port (out only)

COMDATA is used as a clock for LS175, and data is from MDSELDN. The LS175 controls LED's and MOSFET switches for the telephone part of the unit Addresses appear to be the same for on board registers for ZX8302 and ZX8301.

Interrupt is wired to for Interrupt level 2, and the same FC0 / FC1 gated to VPA used for autovectored.

ULA 3 is a logic array of some sort but not complicated (it is registered)

D0	1	28	5V
D1	2	27	C2 on 32 connector
D2	3	26	A6 on 32 connector
D3	4	25	A3 on 32 connector
A13	5	24	A4 on 32 connector
A14	6	23	NC?
A15	7	22	NC?
A18_A19	8	21	64 way C28
/DS	9	20	/CE on 2K CMOS via logic
/DSMC_A19	10	19	M0 Speech
A1	11	18	WS Speech
A0	12	17	RS Speech
R/W	13	16	M1 Speech
0V	14	15	/DTACK

Assumptions – D0-D3 are used with addressing to decode the 4 speech I/O control lines, and the 4 control lines going to the telecom module on the 32 pin connector.

Simple addressing decodes these 2 registers above (the latter may be bi directional?), and decodes for DSMC and the 2K RAM. A19 is used with NAND gate externally to gate DSMC and A18 input.

The 2K CMOS RAM is powered from the Lithium cell or the 9V Battery, and the /CE from the ULA is tied to the power to the IC, presumably to prevent access to the RAM if voltage is unstable.

The keyboard is handled by 2 shift registers. These are 74LS164 and 74LS165 respectively. The 74LS165 handles the 8 Y inputs from the matrix, the 74LS164 drives the 8 X outputs via diodes. There are 2 additional X lines that are not fed by the shift register – these drive the numeric keypad matrix keys that would be used for the telephone dialler. The following table outlines the key matrix:

	X1	X2	X3	X4	X5	X6	X7	X8	9	10
Y1	1 ! |	2 @ ©	3 £ #	4 $	5 % \	6 ^ ~	7 & {	8 * }	'1'	'9'
Y2	TAB	Q	W	E	R	T	Y	U	'2'	'0'
Y3	Ins Del	A	S	D	F	G	H	J	'3'	ESC/*
Y4	L/R Shift	Z	X	C	V	B	N	M	'4'	PRT/#
Y5	9 ([	0)]	Start	Resume	Review	Last Redial	Auto SPKR	List Recall	'5'	
Y6			I	O	P	_-	+=		'6'	
Y7	K	L	: ;	" '	Enter	<,	>.	? /	'7'	
Y8	CTRL	←	→	Space	↑	↓		ALT	'8'	

Grey = unused element

Yellow = Blocking Diode
