

This program allows you to create blank image files for floppy disks and Microdrives.

You will need the Qliberator run-times installed before running the program.

Select the check box for the type of image file you require, Enter an image file name and Medium name. Then click Create Image.

If you leave Sectors blank, then the default is 255 sectors. Likewise the random number, If left blank, then a random number will be used.

If the Image file name is blank, then an appropriate extension is added, and when you click on the filename, the cursor will appear at the start at the left hand side. If you just start typing the supplied extension will be removed. You need to press the left cursor key, before you start typing the device and filename. You will also have to press enter twice to enter the filename. This is due to the MINPUT command in EasyPtr4.

It is compiled with Version 3.45a of Qliberator with the NOWINDS option.
I have only tried the program in QPC2. And it won't be able to handle Mode 8 displays.

The following files are supplied

ImageUtil_obj Qliberated program

Sources

ImageUtil_bas The BASIC program

ImageUtil_cde SuperBASIC extensions for creating the image files

ImageUti_cde An APPMAN file containing EasyPtr4 extensions and the menu

ImageUti_men The EasyPtr4 menu
